

SafeShare

Show the moment,
not your whole phone.

A temporary, PIN-protected viewer for photos, notes and PDFs. Native ArkTS app for OpenHarmony.

One photo to show. One swipe too far.

Hand your phone over to show a photo from the trip, and nothing stops the next swipe: a private picture, a document screenshot, a PDF you'd rather keep to yourself.

- ✗ **Hidden albums** have to be sorted in advance
- ✗ **Extra user profiles** take minutes to set up mid-conversation
- ✗ **So we hover** refuse to let go, or just hope they won't swipe

Hand it over. Walk away.

SafeShare turns the phone into a temporary viewer. Leave it with a friend and go grab a coffee: they can only see what you chose.

1 You choose

A period, a sentence like "photos from the weekend", or single taps.

2 They see only that

Everything else is a locked count, not a preview.

3 PIN to leave

Back, Home or killing the app all end at the owner's PIN.

Everything in **a few taps**

- **One-tap periods**

Today, yesterday, last weekend or any date range.

- **Say it in words**

On-device AI turns a sentence into a proposal. Nothing changes until you approve.

- **Photo by photo**

Tap to add or hide single photos. Notes and PDFs work the same way.

- **Guest viewer**

Swipe, zoom, filmstrip, limited to the shared set only.

- **PIN lock**

Salted hash, lockout after 5 wrong tries. Back, Home or app kill → PIN.

- **Private by design**

Screenshots skip the window. No account, no network, no cloud.

More in the demo video

Two minutes: the problem, our approach and every feature, recorded live on an OpenHarmony device.

▶ **SafeShare_demo.mp4**

SafeShare locks itself, not the whole phone: OpenHarmony doesn't let regular apps block the Home gesture, so full device lockdown needs MDM.
